

005201-69696969

1 1. A high temperature superconducting rotor, comprising:
2 a high temperature superconducting field winding,
3 a field winding support concentrically arranged about the high temperature
4 superconductor field winding, and
5 a thermal reserve concentrically arranged about the field winding support and
6 thermally coupled to the field winding to maintain a temperature differential between the
7 thermal reserve and the field winding not greater than about 10 K.

1 2. The rotor of claim 1 wherein the thermal reserve comprises a material
2 that is thermally conductive.

1 3. The rotor of claim 2 wherein the thermal reserve comprises a material
2 that is electrically nonconductive.

1 4. The rotor of claim 3 wherein the thermal
2 reserve comprises a ceramic material.

1 5. The rotor of claim 3 wherein the thermal reserve comprises Alumina.

1 6. The rotor of claim 3 wherein the thermal reserve comprises ATTA®.

1 7. The rotor of claim 3 wherein the thermal reserve comprises Beryllium
2 Oxide.

1 8. The rotor of claim 2 wherein the thermal reserve comprises an

2 electrically conductive material.

1 9. The rotor of claim 8 wherein the electrically conductive material
2 includes segmentation in a direction normal to the axis of the rotor.

1 10. The rotor of claim 8 wherein the electrically conductive material
2 includes segmentation in a direction along the axis of the rotor.

1 11. The rotor of claim 8 wherein the electrically conductive material
2 comprises aluminum shrunk fit over the field winding support.

1 12. The rotor of claim 1 further comprising a banding concentrically
2 arranged about the thermal reserve.

1 13. The rotor of claim 12 wherein the banding comprises an electrically
2 conductive material.

1 14. The rotor of claim 13 wherein the electrically conductive material
2 includes segmentation in a direction normal to the axis of the rotor.

1 15. The rotor of claim 12 wherein the banding comprises an electrically
2 nonconductive material.

1 16. The rotor of claim 15 wherein the banding comprises Kevlar.

1 17. The rotor of claim 15 wherein the banding comprises glass fiber.

1 18. The rotor of claim 1 further comprising an outer layer concentrically
2 arranged about the thermal reserve, the outer layer comprising a thermally non-conductive
3 material

1 19. The rotor of claim 18 wherein the outer layer comprises an electrically
2 nonconductive material.

1 20. The rotor of claim 18 wherein the outer layer comprises an electrically
2 conductive material.

1 21. The rotor of claim 20 wherein the electrically conductive material is
2 configured to prevent the flow of eddy currents within the electrically conductive material.

1 22. The rotor of claim 21 wherein the outer layer comprises multiple layers
2 of aluminum coated mylar.

1 23. The rotor of claim 22 wherein the aluminum coating includes segments
2 whereby electric current does not flow in a direction along the axis of the rotor.

1 24. The rotor of claim 18 further comprising a banding concentrically
2 arranged about the outer layer.

1 25. A machine comprising:

2 a rotor, said rotor comprising
3 a high temperature superconducting field winding,
4 a field winding support concentrically arranged about the field winding
5 for securing the field winding, the support being electrically isolated from the field winding,
6 an AC flux shield concentrically arranged about the field winding, and
7 a thermal reserve concentrically arranged about the AC flux shield and
8 thermally coupled to the field winding to maintain a temperature differential between the
9 thermal reserve and the field winding not greater than about 10 K; and
10 a stator concentrically arranged about the rotor.

1 26. The machine of claim 25 further comprising a cryogenic refrigeration
2 system thermally coupled to the rotor.

1 *sub*
aa 27. A method of limiting the rate of increase in the temperature of a
2 superconducting winding, comprising:
3 concentrically arranging a thermal reserve about and in thermal contact with the
4 superconducting winding, and
5 maintaining a temperature differential between the thermal reserve and the field
6 winding no greater than about 10 K.

1 28. The method of claim 27 wherein the thermal reserve comprises a
2 thermally conducting material.

1 29. The method of claim 28 further comprising:
2 concentrically arranging a thermally nonconductive material about the

3 thermally conductive material.

1 30. The method of claim 27 further comprising:
2 configuring the thermal reserve to suppress electric eddy currents from
3 flowing about the superconducting winding.

1 31. A high temperature superconducting rotor, comprising:
2 a high temperature superconducting field winding,
3 a field winding support concentrically arranged about the high temperature
4 superconductor field winding, and
5 a thermal reserve concentrically arranged about the field winding support, the
6 thermal reserve including ATTA[®] which is thermally conductive and electrically
7 nonconductive.
